

Sponsorship and partnerships

A student association at the EETAC (UPC)
that designs, builds and launches experimental rockets

✦ Who we are

Hyperion Rockets is a non-profit student association at the School of Telecommunications and Aerospace Engineering of Castelldefels (EETAC), part of the Universitat Politècnica de Catalunya. We design, build and launch experimental rockets.

Our way of working is iterative: not a single project, but a succession of rockets of increasing complexity, each one built on the results and the mistakes of the one before. Every launch is a source of data, and every piece of data is documented.

This document explains how a company can work with us and what we offer in return.

✦ Why partner with us

Visibility with a very specific audience.

Our community is made up of students and professionals in aerospace and telecommunications engineering. It is a small audience, but it is exactly the one that matters to a company in the sector.

Access to technical profiles in training.

Our members are looking for internships and their first job, and they come with hands-on project experience. A partnership is the natural way to get to know them before they enter the job market.

Real technical feedback.

The material we receive is used, pushed to its limits and documented. This produces usage data that we can share back with you.

Support for university talent.

We are a non-profit student association: whatever you contribute goes directly into hands-on training.

★ How you can contribute

Financial support.

Contributions towards materials, manufacturing and launch campaigns.

Materials.

Rocketry components or manufacturing materials, new or surplus stock: airframe tubes, nose cones, composite materials, structural adhesives, recovery components, on-board electronics or workshop supplies.

Manufacturing services.

Machining, technical 3D printing, laser cutting or the production of parts we cannot make with the school's facilities.

Technical advice.

Design reviews, occasional consultations with the company's engineers, and guidance on choosing materials and processes. This is often worth more than the materials themselves.

Access to facilities or instrumentation.

Tests, measurements or verifications that we cannot carry out at the school.

We do not publish a fixed list of needs: they are defined project by project, and we discuss them with you before asking for anything.

✦ What we offer in return

The benefits are agreed case by case, depending on the scope of the partnership and on what interests the company.

Brand presence

- **Your logo on our rockets**, in a visible position agreed in advance.
- **Your logo on our website**, in a partners section with a link to your website.
- **Presence in our outreach materials**: posters, presentations and graphic materials for our activities.

Outreach

- **Posts on our social media**, explicitly mentioning the partnership when it is formalised and at key moments of the project.
- **Content from our launch campaigns**: photos and videos with your logo visible, which we also make available to the company for its own use.
- **Mention in our technical documentation**: our design and post-flight reports include an acknowledgements section.

Relationship with our members

- **A direct channel for internships and recruitment**. We put you in touch with interested members, so that you get to know their profiles first-hand and with real work behind them. Taking part is always each member's own decision.
- **Talks and visits**. You can present your work to our members, at the school or at your own facilities. This is one of the benefits we value most, because it is training.

Technical feedback

- **Material usage report**: how it was used, how it performed and what conclusions we drew.
- **Flight data and analysis** from the campaigns in which donated material was used.
- **An invitation to the launch campaign**.

✦ Our approach

We do not work with fixed sponsorship tiers such as bronze, silver and gold. We prefer not to set a rigid structure or commit to benefits we are not sure we can deliver.

Our approach is a conversation: we sit down together, the company tells us what it can contribute and what it expects in return, and we agree in writing on a set of benefits proportionate to that contribution.

We would rather have a modest agreement that is fulfilled than an ambitious one that is not.

We propose agreements for one academic year, renewable.

✦ What we do not promise

It is better to say this from the start. Some things are not in our hands, so we do not include them as benefits:

- **We cannot commit the communication channels or the institutional image of the UPC or the EETAC.** We are a student association of the school, not the school itself.
- **We cannot commit to promotion by third parties** we work with, nor present them as endorsers of a sponsorship agreement.
- **We do not guarantee launch dates** until they are authorised, because they depend on design approval, the weather and flight authorisation.
- **We do not offer sector exclusivity by default**, but it is open to discussion.

Everything in the benefits section depends solely on us, and that is why we offer it.

★ Safety

This is where a company may have the most legitimate concerns, which is why we put it in writing.

High-power rockets are not launched informally. Our flights take place within the current regulatory framework and follow the safety codes of the leading organisations, which set specific requirements for rail exit velocity, thrust-to-weight ratio, descent rate, safety distances and weather conditions. The design undergoes an external review before the flight is authorised, and the launch takes place in a supervised environment.

At the school, construction takes place in authorised spaces and workshops. Motors and pyrotechnic charges are handled in compliance with the applicable regulations on their purchase, transport and storage.

A partnership does not make the company responsible in any way for the flight or for the operation of the rocket.

Let's talk

If the proposal is a good fit, or if there is anything you would like to rethink, write to us and we will discuss it with no obligation. You do not need to have anything decided, either: if you are simply curious about the project, you are welcome to write to us too.
